Hobustega sõit jääl Das Eis war fahrbar	lõpp Ende algus Anfang	. 2. XII.

Märkusi 1931. aasta kohta.

Meteoroloogia Observatooriumi vaatlused on toimetatud samade mõõtmisriistadega ja sama kava järgi nagu eelmiselgi aastal.

Õhurõhumise andmed on avaldatud millibaarides. Mõõtarvud, mis on võrdsed 1000.0 mb või sellest suuremad, on tabelis trükitehnilistel põhjustel vähendatud 1000.0 mb võrra. Nii näiteks 012.4 tähendab 012.4 + 1000.0 = 1012.4 mb.

Käesolevas aastaraamatus esinevad esmakordselt päikese kiiritamise intensiivsuse vaatlusandmed (lk. 91 ja 92). Mõõtmisriistana kasutati Angstöm'i kompensatsioon-pürheliomeetrit Nr. 197, mille konstantarv on 14.78. Mõõtmine toimus ajal, mil taevas oli kas üleni või vähemalt päikese kohalt täiesti selge. Pürheliomeeter asetses mõõtmise ajal Meteoroloogia Observatooriumi torni platvormil betoonaluspostil 27 m kõrgusel maapinnalt. Vaatlusajad on tabelis märgitud Ida-Euroopa aja järgi.

Observatooriumi kaastööliste isiklikku koosseisu kuulusid 1931. aastal: teaduslik ametnik — H. Liedemann; van. assistendi k. t. — E. Maalman; abiassistent A. Kärsna (kuni 30. VI) ja K. Sule (alates I. VII); sünoptikud — A. Ohu, A. Nurklik (viimane kuni 30. VI) ja A. Kärsna (alates 1. VII); abijõud — J. Limberg; vaatlejad — J. Kukk ja P. Anso, kantseleiametnikud — H. Raphoph ja T. Livländer.

Käesolevas aastaraamatus avaldatud Tartu Meteoroloogia Observatooriumi vaatlused on kontrollitud H. Liedemanni ja allakirjutanu poolt.

K. Frisch

Meteoroloogia Observatooriumi juhataja.

Bemerkungen zum Jahrgang 1931.

Die Beobachtungen am Meteorologischen Observatorium sind mit Hilfe derselben Instrumente und unter denselben Bedingungen angestellt worden, wie im vorhergehenden Jahre.

Die Luftdruckbeobachtungen sind in Millibar veröffentlicht, wobei die Daten, welche 1000.0 mb oder mehr betrugen, in den Tabellen aus technischen Gründen um 1000.0 mb verkleinert worden sind. Z. B. 012.4 bedeutet 012.4 + 1000.0 = 1012.4 mb.

Die im vorliegenden Jahrbuch zum ersten Mal veröffentlichten Beobachtungen der Intensität der Sonnenstrahlung sind mit Hilfe des Angströmschen Kompensationspyrheliometers Nr. 197 vom Turme des Observatoriums aus (27 m über dem Meeresniveau) angestellt worden. Die Konstante des Apparates betrug 14.78. Die Messungen wurden bei vollständig klarem, oder zum mindesten in der Nähe der Sonne klarem Himmel nach Ost-Europäischer Zeit vorgenommen.

Der Personalbestand im Jahre 1931 war folgender: wissenschaftlicher Beamter — H. Liedemann; älterer stellvertretender Assistent — E. Maalmann; Hilfsassistenten — A. Kärsna (bis 30. VI) und K. Sule (vom 1. VII); Synoptiker — A. Ohu, A. Nurklik (letzterer bis 30. VI) und A. Kärsna (vom 1. VII); Hilfskraft — J. Limberg; Beobachter — J. Kukk und P. Anso; Kanzeleibeamtinnen — H. Raphoph und T. Livländer.

Die Kontrolle der im Jahrbuch veröffentlichten Daten erfolgte durch H. Liedemann und den Unterzeichneten.

K. Frisch

Direktor des Meteorologischen Observatoriums.

Märkusi II järgu jaamade kohta 1931. a.

Kõigis II järgu meteoroloogiajaamades toimetati vaatlusi samatüübiliste vaatlusinstrumentidega ühise kava järgi, nagu eelmistel aastatel.

Vaatluste tähtaegadel mõõdeti õhurõhumist kaussbaromeetritega, kuna õhurõhumise käiku registreerisid Richard'i barograafid. Psühromeetrid, äärmustermomeetrid, juushügromeetrid ja termograafid asetsesid inglise onnides. Tuule suuna ja kiiruse mõõtmiseks tarvitati Wild'i süsteemi tuulelippe. Sademeid mõõdeti sademetemõõtjatega püüdepinnaga 500 cm^2, mis varustatud tuulekaitsjatega. Peale ülalmainitud instrumentide olid jaamades päikesepaiste isemärkijatena tarvitusel Velitško süsteemi heliograafid.

Kõigis jaamades toimetati vaatlusi keskmise kohaliku aja järgi kell 7, 13 ja 21. Sademete hulk iga päeva kohta on antud millimeetrites hom. k. 7-st järgneva päeva kella 7-ni.

Märkustes leiduvad tähed n, a ja p tähendavad aega vaatluste vahel:

n — eelmise päeva kella 21-st k. 7-ni
a — kella 7-st k. 13-ni
p — kella 13-st k. 21-ni.

Kõigis vaatlusandmeis on arvestatud vastavaid instrumentaalõiendusi, ning õhurõhumise andmeis ka veel temperatuuri ja raskuse õiendusi.

Vaatlusandmed on avaldatud 22 jaamast, mille konstantarvud on tabelis lk. 92.

Narva-Jõesuu baromeeter on 1. juunil 1931. a. ümber paigutatud sadamakapteni kantseleist mereside meeskonna ruumi. Baromeetri kõrgus merepinnalt uues asukohas 9,8 m. Käesolevas aastaraamatus on õhurõhumise andmed avaldatud endise asukoha kõrguse järgi.

Võru meteoroloogiajaam viidi maikuul 1931 gümnaasiumi juurest 7. jalaväerügemendi kasarmute juurde. Tuulelipu kõrgus uuel asukohal on endine. Baromeetri kõrgus uuel asukohal 92,2 m. Käesolevas aastaraamatus on kõik meteoroloogilised andmed maikuuni avaldatud endise asukoha järgi, juunikuust alates aga uue asukoha järgi.

Käesolevas aastaraamatus esinevad esmakordselt Värska meteoroloogiajaama andmed, mis jaam algas tegevust 1930. a. sügisel, samuti esinevad esmakordselt käesolevas aastaraamatus Ruhnu met. jaama andmed, mis jaam samuti algas tegevust 1930. a. sügisel.

Vaatlusandmete läbitöötamist toimetasid Met. Observatooriumi ametnikud H. Raphoph ja T. Livländer.

Jaamade revideerimist koha peal, vaatlusriistade võrdlust ja vaatluste kontrolli teostasid Joh. Limberg ja allakirjutanu.

Dr. K. Frisch.
Met. Observatooriumi Juhataja.

Bemerkungen zu den Beobachtungen an den Stationen II Ordnung im Jahre 1931.

An allen Stationen wurden die Beobachtungen wie auch in den vorhergehenden Jahren einheitlich an denselben Beobachtungsapparaten angestellt. Der Luftdruck wurde um die Beobachtungszeiten an Gefäss-Barometern abgelesen und durch Richard'sche Barographen registriert. Die Psychrometer, Extremthermometer, Haarhygrometer und Thermographen waren in englischen Hütten aufgestellt. Die Windmessung erfolgte an Wild'schen Windfahnen, die der Niederschläge an mit Schutzkegeln versehenen Regenmessern mit der Auffangfläche von 500 cm^2. Die Sonnenscheindauer wurde mittels Welitschko'scher Heliographen registriert.

Die Beobachtungen erfolgten an allen Stationen nach der mittleren Lokalzeit um 7^h, 13^h und 21^h. Als Niederschlagsmenge eines gegebenen Tages gelten die von 7^h morgens bis 7^h morgens des nächsten Tages gefallenen Niederschläge.

Die in den Anmerkungen vorkommenden Buchstaben n, a, p bedeuten die Zeit zwischen den Beobachtungsterminen:

n — vom vorhergehenden Tage 21^h bis 7^h morgens,
a — von 7^h bis 13^h,
p — von 13^h bis 21^h.

An allen Beobachtungsdaten wurden entsprechende Instrumentalkorrektionen angebracht, an denen des Luftdruckes auch die Temperatur- und Schwerekorrektion.

Veröffentlicht sind die Beobachtungen von 22 Stationen, deren Konstanten in der Tabelle auf Seite 92 enthalten sind.

Das Barometer in Narva-Jõesuu, welches sich bis zum 1 Juni 1931 in der Kanzelei des Hafenkapitäns befand, wurde nun in den Räumen der Marine aufgestellt. Die Höhe des Barometers über dem Meeresniveau im neuen Beoachtungspunkt beträgt 9,8 m. Die im vorliegenden Jahrbuch veröffentlichten Luftdruckdaten beziehen sich auf die Höhe des alten Beobachtungspunktes.

Die meteorologische Station in Võru wurde im Mai 1931 aus dem Gymnasium in die Kaserne des 7. Infanterieregiments übergeführt. Die Höhe der Windfahne ist am neuen Beobachtungsort dieselbe, wie auch am vorhergehenden, die Höhe des Barometers

92,2 m. Im betreffenden Jahrbuch sind bis zum Mai die Daten des früheren und vom Juni an die des neuen Beobachtungspunktes gegeben.

Im vorliegenden Jahrbuch sind zum ersten Mal die meteorologischen Daten von Värska und Ruhnu veröffentlicht. Beide Stationen begannen ihre Tätigkeit im Herbst 1930.

Die Beobachtungsdaten wurden von den Beamtinnen des Observatoriums H. Raphoph und T. Livländer bearbeitet. Die Revision der Stationen sowie die Kontrolle der Beobachtungsapparate und der Beobachtungsdaten erfolgte durch J. Limberg und den Unterzeichneten.

Dr. K. Frisch.
Direktor des Meteorol. Observatoriums.

Märkusi sademete, kõue ja lumikatte vaatluste kohta.

Alamajärgulistes ilmajaamades ja vaatluskohtades toimetati sademete, kõue ja lumikatte vaatlusi. Peale selle märgiti mõnedes vaatluskohtades veel sisevete kinnikülmumist ja lahtiminekut.

1931. a. töötas Eestis 89 sademetejaama. Nende vaatlusandmed on käesolevas aastaraamatus avaldatud koos 23 II järgu meteoroloogiajaama andmetega.

Sademete hulka mõõdeti iga päev kella 8 ajal tuulekaitsjatega varustatud sademetemõõtjatega, mille püüdepind on 500 sm^2. Kõik sademetemõõtjad asetsesid 2 meetri kõrgusel maapinnalt. Tabelites esinevad sademete kuu- ja aasta-summad, kõige suurem ööpäevane hulk ja päevade arv sademetega. Lumepäevadeks on arvatud need päevad, mil on sadanud lund, ning sademete koguhulk homm. kella 8-st järgmise päeva kella 8-ni oli vähemalt 0,1 mm.

Kõue- ja rahevaatlusi toimetati 115 vaatluskohas. Tabelites on märgitud kõue ja rahesaju algus ning kõue- ja rahepäevade arv. Märk ◹ tähendab lähedat kõuet, ┬ — kauget kõuet, ◃ — pälku. Rahekahjudega päevad on trükitud rasvases kirjas. Tabelites leiduv punkt (·) tähendab, et pole toimetatud vaatlusi, kriips (—) aga, et pole olnud vastavat nähtust.

1931./32. a. talvel on lumikatte kõrguse kohta andmeid 126 vaatluskohast. Lumikatte kõrgust mõõdeti, nagu eelmistelgi talvedel, kell 8 hommikul. Vaatlustel tarvitati sentimeeter-jaotustega mõõdupuud, mis asetatud tuule eest kaitstud tasasele kohale.

Tabelites leidub dekaadide (10 päeva keskmine) lumekõrgus sentimeetrites. Null (0) tähendab, et dekaadi keskmine lumekõrgus oli alla 0,5 sentimeetri, kriips (—), et dekaadi jooksul pole üldse olnud lumikatet, punkt (·), et pole toimetatud vaatlusi.

Kõue, rahe kui ka lumikatte vaatluste jaoks on antud ühine vaatluskohtade nimestik, kus märk ◹ tähendab, et vastavas vaatluskohas toimetati ainult kõue- ja rahevaatlusi, märk * aga, et mõõdeti ainult lumikatte kõrgust.

Kõigis tabelites on vaatluskohad järjestatud geograafilise pikkuse järgi läänest idasse.

Sisevete kinnikülmumise ja lahtimineku ajad leiduvad tabelis lk. 146. Kinnikülmumise ajaks loeti päeva, mil vaadeldav veeala kattus kas või õhukese jääkorraga, või mil liikuv jää seisma jäi ning kokku külmus.

Vete lahtimineku ajaks loeti päeva, mil jääkate katkes, või hakkas liikuma.

Vaatlusandmed töötasid läbi Observatooriumi ametnikud H. Raphoph ja T. Livländer, vaatluste kontrolli teostasid Joh. Limberg ja allakirjutanu.

Dr. K. Frisch.
Met. Observatooriumi juhataja.

Bemerkungen zu den Niederschlags-, Gewitter- und Schneebeobachtungen.

An den Stationen niederer Ordnung wurden die Niederschläge, die Gewitter, die Hagelfälle sowie die Höhe der Schneedecke beobachtet. An einzelnen Beobachtungspunkten wurde ausserdem der Zu- und Aufgang der Binnengewässer notiert.

Im Berichtsjahr waren 89 Regenstationen in Tätigkeit, zu denen die Beobachtungen an 23 Stationen II. Ordnung hinzukommen.

Die Niederschlagsmengen wurden täglich um 8 Uhr morgens an Regenmessern, die eine auffangfläche von 500 cm^2 besassen und mit Schutzkegeln versehen waren, gemessen. Alle Regenmesser waren in gleicher Höhe aufgestellt, so dass der obere Rand sich 2 Meter über der Erdoberfläche befand. In den Beobachtungstabellen finden sich die Monats- und Jahressummen, die grösste Tagesmenge sowie die Zahl der Tage mit Niederschlägen an den einzelnen Stationen.

Als Tage mit Schnee gelten solche, an denen es geschneit hat, und an denen die Niederschlagsmenge von 8 Uhr morgens bis zum nächsten Morgen 8 Uhr wenigstens 0.1 mm betrug.

Gewitter- und Hagelbeobachtugnen sind an 115 Beobachtungspunkten angestellt worden. In den Tabellen sind angegeben die Zeit des Beginns der Erscheinung sowie die Anzahl der Gewitter- bzw. Hageltage an den einzelnen Beobachtungspunkten. Die Zeichen ⊠, ⊤ und ≤ bedeuten Nahgewitter, Ferngewitter und Wetterleuchten. Die Tage mit Hagelschäden sind fett gedruckt.

In den Tabellen bedeutet ein Punkt (·), dass im entsprechenden Monat keine Beobachtungen angestellt worden sind, währnd ein Strich (—) anzeigt, dass keine entsprechende Erscheinung zur Beobachtung kam.

Messungen der Schneehöhe im Winter 1931/1932 sind von 126 Stationen eingelaufen. Die Messungen erfolgten täglich um 8 Uhr morgens an in Centimeter eingeteilten Massstäben, die an ebenen und vor Wind geschützten Stellen aufgestellt waren. In den Tabellen befindet sich die mittlere Schneehöhe für die Dekaden (Das Mittel von 10 Tagen) in Centimetern. In den Fällen, wo der Mittelwert 0.5 cm nicht erreichte, steht in der Tabelle eine 0. Ein Strich (—) bedeutet das Fehlen der Schneedecke, ein Punkt (·) das Fehlen der Beobachtung.

Die Gewitter- und Schneebeobachtungen haben ein gemeinsames Stationsverzeichnis. Die Zeichen ⍓ und * vor den Beobachtungspunkten geben an, dass an den betreffenden Stationen nur Gewitter und Hagel bzw. die Schneedecke beobachtet wurde.

In allen Tabellen sind die Stationen der geographischen Länge nach von Westen nach Osten geordnet.

Die Beobachtungen über den Auf- und Zugang der Binnengewässer befinden sich auf S. 146. Als Tag des Zugangs gilt derjenige, an dem die Oberfläche des Gewässers mit einer wenn auch nur leichten Eisdecke bedeckt oder das Treibeis gefroren und zum Stillstand gekommen war, als Tag des Aufgangs derjenige, an dem das Eis am Beobachtungsort aufgangen oder in Bewegung geraten war.

Bearbeitet wurden die Beobachtungen von den Beamtinnen des Observatoriums H. Raphoph und T. Livländer, die Kontrolle erfolgte durch Joh. Limberg und dem Unterzeichneten.

Dr. K. Frisch.
Direktor des Meteorologischen Observ.
