## Замѣчанія о наблюденіяхъ 1901 г.

**Личный составъ.** Лаборантъ обсерваторіи, канд. К. Г. Кохъ, былъ въ отчетномъ году съ 14 іюня по 29 іюля въ командировкѣ для ревизіи дождемѣрныхъ станцій Императорскаго Лифляндскаго общепользнаго и экономическаго общества и отъ послѣдняго числа до 14 августа находился въ отпуску. Въ должности сверхштатнаго ассистента былъ утвержденъ наблюдатель обсерваторіи, В. Ф. Франкенъ. Кромѣ того, въ наблюденіяхъ принималъ участіе студ. Г. Г. Кохъ.

Обработка и подготовка наблюденій къ печати, а также и составленіе мѣсячныхъ отчетовъ для Главной Физической Обсерваторіи въ первое полугодіе производилось г. Кохомъ, во второмъ же полугодіи эту работу выполнялъ г. Франкенъ, а г. Кохъ занимался въ библіотекѣ и дважды въ сутки составлялъ для вывѣшванія къ общему свѣдѣнію бюллетени погоды по телеграммамъ Главной Физической Обсерваторіи и по наблюденіямъ мѣстной Обсерваторіи. Кромѣ того, онъ-же ежедневно наблюдалъ въ магнитномъ павильонѣ склоненіе и наклоненіе и вычислилъ постоянныя и поправку магнитнаго теодолита.

Научное руководство съѣтью дождемѣрныхъ станцій Императорскаго Лифляндскаго общепользнаго и экономическаго общества принадлежало какъ и прежде профессору Б. И. Срезневскому; помощникомъ его состоялъ лаборантъ К. Г. Кохъ. Отчеты мѣсячные и годовой были опубликованы по примѣру предшествующаго года и для отчет-

наго. Далѣ была выработана и разослана новая инструкція для наблюдателей, а также обревизовано въ теченіе лѣтнихъ мѣсяцевъ большое число станцій. Въ отчетномъ году сѣтъ значительно увеличилась вслѣдствіе присоединенія къ ней Курляндіи, гдѣ возникло около 40 новыхъ станцій.

**Наблюденія** въ отчетномъ году, первомъ восьмого пятилѣтія, были измѣнены въ томъ отношеніи, что всѣ метеорологическіе элементы наблюдались только въ установленныя для Россіи три срока: 7<sup>на</sup>, 1<sup>на</sup>, 9<sup>на</sup>. По примѣру прежнихъ лѣтъ, осадки и минимальный термометръ наблюдались въ 7<sup>на</sup> и 9<sup>на</sup>, максимальный термометръ въ 1<sup>на</sup> и 9<sup>на</sup>, высота снѣжнаго покрова и испареніе въ 7<sup>на</sup>, уровень Эмбаха въ 1<sup>на</sup>.

**Давленіе воздуха** отсчитывалось за 5 минутъ до срочныхъ часовъ по сифонному барометру Шульце № 2. Поправка его, опредѣленная г. Дубинскимъ по сравненію съ нормальнымъ барометромъ Николаевской Главной Физической Обсерваторіи въ іюнѣ 1892 г., равняется 0.00 mm. Въ маѣ 1902 г. новое сравненіе барометра было произведено при помощи барометра, пріобрѣтеннаго мѣстнымъ Реальнымъ Училищемъ и только-что провѣреннаго Главной Физической Обсерваторіей. Среднее изъ 10 сравненій дало для нашего барометра поправку въ — 0.02 mm., которая даетъ право считать нашъ инструментъ точнымъ. Къ показаніямъ термометра при барометрѣ придавалась, какъ и ранѣе, поправка въ — 0.04, вѣрность которой подтверждена новымъ сравненіемъ въ январѣ отчетнаго года. Для контроля, въ теченіи большей части года, а именно, съ 1 января до 26 февраля и съ 10 апрѣля до конца года, отсчитывался 3 минуты до срока барометръ Вильдъ-Турреттини № 16. Въ остальное время инструментъ былъ на станціи при мѣстномъ реальномъ училищѣ для контроля тамошняго барометра. Поправка къ показаніямъ барометра № 16 не придавалась, но каждый разъ вычислялась разность между его показаніями и показаніями барометра Шульце. Эта разность въ среднемъ равна 0.21 mm. и обнаружила небольшія колебанія.

## Т а б л и ц а I.

## Бар. Шульце — бар. Турреттини.

Изъ этой таблицы до нѣкоторой степени, но не такъ ясно, какъ въ предыдущіе годы, можно констатировать вліяніе температуры на суточный и мѣсячный ходъ разностей.

Для непрерывной регистраціи атмосфернаго давленія служилъ, какъ и прежде, барометръ-анероидъ Р и ш а р а № 9939, который все время функционировалъ исправно. Въ слѣдующей табличкѣ даны разности мѣсячныхъ среднихъ давленія, полученныхъ по барометру Шульце № 2 и по барографу.

## Т а б л и ц а II.

## Барографъ — барометръ Шульце.

|                | Янв. | Фев. | Мартъ | Апр. | Май  | Юнь  | Юль  | Авг. | Сент. | Окт. | Нояб. | Дек. | Годъ |

Такимъ образомъ показанія барографа возрасли въ теченіе года на 1 мм.

Установка барометровъ вслѣдствіе тѣсноты помѣщенія обсерваторіи неудовлетворительна и притомъ ее невозможно улучшить. Инструменты находятся вблизи окна низкой, тѣсной и отопливаемой комнаты, въ разстояніи 6 метровъ отъ печки и  $\frac{1}{2}$  метра отъ окна. Такъ какъ при открытомъ положеніи обсерваторіи усиленная топка необходима, то особенно зимою отъ печки къ окну и снизу вверхъ получается такой сильный токъ теплаго воздуха, что различныя части барометровъ имѣютъ неодинаковую температуру. Вслѣдствіе этого точная поправка на температуру невозможна. Такъ какъ, въ виду вышезложеннаго, трудно ожидать большой точности въ опредѣленіяхъ суточнаго хода атмосфернаго да-

вленія, мы отказались въ отчетномъ году отъ обработки еже-  
 часныхъ барографическихъ датъ и даемъ только непосредствен-  
 ные отсчеты барометра въ три срока. Къ этимъ отсче-  
 тамъ придавалось въ первый разъ въ этомъ  
 году поправка на тяжесть, равная 0·9 mm.

По истеченіи отчетнаго года барометръ № 16 переведенъ  
 въ метеорологическій кабинетъ, въ помѣщеніе, удобное для  
 барометрическихъ наблюдений, и тамъ отсчитывается. Тамъ-же  
 помѣщается и функционируетъ ртутный барографъ Р и шара  
 № 11558.

**Наблюдения надъ температурой** производились съ  
 помощью аспираціоннаго психрометра Ассмана № 139  
 съ термометрами № 677 (сухой) и № 1039 (смоченный).  
 Вслѣдствіе непрочности часоваго механизма, инструментъ  
 приходилось нѣсколько разъ отдавать въ починку, именно,  
 отъ 12—14 января и отъ 7 іюня до 5 сентября; въ теченіе  
 этого времени употреблялся такой-же аппаратъ № 99 съ  
 термометрами № 655 и № 656. За отсутствіемъ электри-  
 ческаго освѣщенія, психрометръ отсчитывался только при  
 дневномъ освѣщеніи на установкѣ у окна, описанной въ  
 отчетѣ 1894 г., а именно въ 7<sup>h</sup>а съ 5 марта по 1 ноября,  
 въ 1<sup>h</sup>р въ теченіе всего года и въ 9<sup>h</sup>р съ 24 мая по  
 28 іюля; въ остальное время наблюденія производились пси-  
 хрометромъ въ будкѣ на крышѣ. При этомъ высота пси-  
 хрометра надъ поверхностью земли равнялось въ первомъ  
 случаѣ 12 метрамъ, а въ будкѣ 9 метрамъ. Различную уста-  
 новку психрометра — у окна или въ будкѣ — мы считали  
 допустимой, такъ какъ по точнымъ изслѣдованіямъ въ нашей  
 обсерваторіи (отчетъ 1894 г.) въ темное время, именно въ  
 сроки 7<sup>h</sup>а и 9<sup>h</sup>р, два источника погрѣшности, съ которыми  
 приходится считаться при установкѣ психрометра въ будкѣ:  
 болѣе сильное запаздываніе и вліяніе излученія, почти со-  
 вершенно исчезаютъ.

Такъ какъ суточный ходъ температуры вычисленіями,  
 доведенными до конца предыдущаго года, казался достаточно  
 опредѣленнымъ, то въ настоящемъ изданіи печатаются только

наблюденія въ 3 срока: 7<sup>а</sup>, 1<sup>в</sup>р и 9<sup>в</sup>р. Для спеціальныхъ-же изслѣдованій заведенъ термографъ, большаго размѣра, который и функционировалъ съ начала отчетнаго года. Только въ промежутокъ времени отъ 7—9 ноября во время чистки этотъ новый термографъ Ришара № 26270, установленный въ будкѣ на крышѣ, замѣнялся старымъ термографомъ Ришара № 10023. Два раза въ истекшемъ году, термографъ приходилось заново жюстировать, причѣмъ 29 апрѣля нулевая точка его шкалы была понижена на 15 дѣленій, а 25 ноября повыше ровно на столько же. Такая жюстировка обусловлена размѣрами шкалы прибора, обнимающей всего 50° и доходящей только до — 15°. Возлѣ Бурдоновой трубы его былъ прикрѣпленъ термометръ безъ вентиляціи, который отсчитывался въ каждый срокъ для того, чтобы получить показанія, сравнимыя съ показаніями, какъ психрометра, такъ и термографа.

Въ слѣдующей таблицѣ даны разности мѣсячныхъ среднихъ температуры по этому термометру и по термографу, причѣмъ показанія послѣдняго соотвѣтственно исправлены вычитаніемъ въ зимнее время величины 15 градусовъ, обусловленной вышеназванной жюстировкой.

### Т а б л и ц а III.

#### Термографъ — термометръ.

|                | Янв. | Фев. | Мартъ | Апр. | Май   | Июнь  | Июль  | Авг.  | Сент. | Окт.  | Нояб. | Дек.  | Годъ |

Ходъ среднихъ величинъ явно показываетъ минимумъ разности термографъ — термометръ въ теплое время дня и года.

Для опредѣленія вліянія ненормальной установки будки, показанія термометра при термографѣ были сопоставлены съ показаніями психрометра и притомъ отдѣльно для установокъ психрометра въ будкѣ и у окна.

## Т а б л и ц а IV.

Термометръ — Психрометръ Ассмана (въ будкѣ).

## Т а б л и ц а V.

Термометръ — Психрометръ Ассмана (у окна).

|                 | Янв. | Фев. | Мартъ | Апр. | Май  | Юнь  | Юль  | Авг. | Сент. | Окт.  | Нояб. | Дек. | Ср.  |
|-----------------|------|------|-------|------|------|------|------|------|-------|-------|-------|------|------|
| 7 <sup>на</sup> | —    | —    | -0·06 | 0·05 | 0·30 | 0·40 | 0·45 | 0·16 | -0·03 | -0·06 | —     | —    | —    |
| 1 <sup>пр</sup> | 0·07 | 0·18 | 0·47  | 0·45 | 0·55 | 0·77 | 0·89 | 0·51 | 0·55  | 0·43  | 0·22  | 0·16 | 0·44 |
| 9 <sup>пр</sup> | —    | —    | —     | —    | 0·09 | 0·27 | 0·06 | —    | —     | —     | —     | —    | —    |

Ходъ среднихъ разностей въ этихъ двухъ таблицахъ ясно обнаруживаетъ вліяніе установки будки на крышѣ: между тѣмъ какъ, благодаря высокому положенію, будка настолько хорошо вентилируется, что термометры съ вентиляціей и безъ вентиляціи въ темное время даютъ почти одинаковыя показанія, съ другой стороны она при инсоляціи отъ крыши въ значительной степени нагрѣвается. Ровный ходъ разности температуръ въ обѣихъ таблицахъ, особенно въ 9<sup>пр</sup>, доказываетъ однородность показаній психрометра въ различныхъ установкахъ. Суточный ходъ температуры по даннымъ термометра безъ вентиляціи, а слѣдовательно и термографа въ будкѣ при инсоляціи такъ искажается, что послѣ полудня температура повышается, даже въ годовомъ среднемъ, на 0<sup>о</sup>44. Еще болѣе искаженіе, получаемое изъ показаній максимальнаго и минимальнаго термометровъ безъ вентиляціи, которые даютъ амплитуду болѣе истинной повидимому слишкомъ на одинъ градусъ.

Крайнія температуры отсчитывались по максимальному термометру Мюллера № 4232 и по минимальному термометру (безъ номера) Рихтера; оба были установлены въ будкѣ. Въ ноябрѣ отчетнаго года при помощи многочисленныхъ сравненій съ психрометромъ были найдены слѣдующія поправки:

для максимальнаго термометра Мюллера

№ 4232 при повышающейся температурѣ — 0<sup>о</sup>02

для минимальнаго температура Рихтера

при понижающейся температурѣ — 0<sup>о</sup>06

Вслѣдствіе своей незначительности, эти поправки не принимались во вниманіе, и подъ рубрикой „Minimum“ печатались неисправленные показанія минимальнаго термометра. Эти данныя существенно отличаются отъ крайнихъ, записанныхъ термографомъ и еще болѣе отъ крайнихъ, взятыхъ изъ срочныхъ наблюденій. Что же касается данныхъ, печатавшихся подъ рубрикой максимумъ, то онѣ представляютъ собою величины, выведенныя согласно инструкціи Главной Физической Обсерваторіи изъ данныхъ срочныхъ наблюденій. Однако съ большимъ правомъ слѣдовало бы помѣстить подъ этой рубрикой величины, показанныя максимальнымъ термометромъ, которые ближе къ крайнимъ, записаннымъ термографомъ; чтобы сдѣлать это очевиднымъ, приведемъ сопоставленіе всѣхъ ихъ въ слѣдующей таблицѣ.

Данныя крайнихъ термометровъ хорошо согласуются съ данными термографа, если принять во вниманіе, что послѣдній инструментъ долженъ давать всегда немного меньшія абсолютныя показанія вслѣдствіе своей большей инертности. Значительная разность въ январскихъ минимумахъ происходитъ отъ того, что они пали на 1 января и что минимальный тер-

мометръ показываетъ температуру въ 9<sup>h</sup>р. 31 дек. 1900, между тѣмъ какъ у термографа взята температура отъ 12<sup>h</sup>п.; соответственная температура для 9<sup>h</sup>р. была бы — 18<sup>o</sup>8.

**Влажность воздуха** вычислялась по показаніямъ психрометра Асмана (по формулѣ Шпрунга) при температурахъ выше нуля. Вычисленные величины относительной влажности при температурахъ выше нуля сопоставлялись съ показаніями гигрометра (съ 1 января по 1 сентября № 9 Г. Ф. О., а съ этого времени до конца года подобный же инструментъ № 13), котораго поправки выведены были на основаніи правила равныхъ повторемостей. Этими поправками (см. стр. 26) въ случаяхъ температуры ниже 0<sup>o</sup> исправлялись показанія гигрометра для вычисленія относительной влажности, а затѣмъ и упругости пара и недостатка насыщенія.

Мѣсячныя среднія для относительной влажности  $r$ , вычисленные по формулѣ Вейрауха  $\frac{\sum a}{\sum s} = r$ , гдѣ  $a$  — абсолютная влажность и  $s$  — упругость насыщеннаго пара, приведены въ слѣдующей таблицѣ.

| Годъ     | 82·5           | 60·7            | 77·5            | 72·3 |

Непрерывная регистрація влажности производилась гигрографомъ Ришара № 8814, установленнымъ въ будкѣ. Его показанія, служившія для специальныхъ изслѣдованій, были

приведены къ показаніямъ психрометра точно такимъ-же способомъ, какъ выше показанія гигрометра.

**Измѣреніе вѣтра** производилось по анемографу Эттингена-Шульце № 4, дополненіемъ къ которому служилъ подобный-же аппаратъ № 1. Для вычисленія скорости вѣтра въ километрахъ въ часъ употреблялись слѣдующія формулы :

$$\text{для № 4 } v = 1.72 + 0.82 n, \text{ и}$$

$$\text{для № 1 } v = 1.00 + 1.67 n.$$

Эти формулы въ предыдущіе года были провѣрены многочисленными сравненіями. Въ отчетномъ году, за неимѣніемъ безупречнаго нормальнаго инструмента, не было произведено новыхъ опредѣленій постоянныхъ. Печатаніе еже-часныхъ данныхъ скорости и направленія вѣтра производится по примѣру прежнихъ лѣтъ, безъ всякихъ измѣненій.

Чистка аппаратовъ производилась 2 іюля безъ остановки ихъ дѣйствія. Ночью 13 февраля оба аппарата на нѣсколько часовъ замерзли и въ періодъ времени отъ 8 до 15 февраля дѣйствіе ихъ, казалось, нѣсколько разъ задерживалось, вслѣдствіе чрезвычайно сильнаго образованія инея, что, однако, скоро было замѣчено. Замерзаніе того или другого аппарата случалось еще не разъ, но упущенія записи при этомъ не было, такъ какъ одинъ изъ аппаратовъ всегда оставался въ дѣйствіи.

**Испареніе** измѣрялось по эвапорометру Г. Ф. О. № 3, установленному въ будкѣ на высотѣ 9 метровъ надъ поверхностью земли. Недостаткомъ установки слѣдуетъ считать высоту будки, вслѣдствіе чего при сильномъ вѣтрѣ въ чашку заносится снѣгъ и дождь.

**Осадки** наблюдались по дождемѣру, снабженному защитою Нифера и установленному на высотѣ 12 метровъ надъ поверхностью земли. Возможно, что при такой высотѣ установки, не смотря на защиту, вѣтеръ оказывалъ нѣкоторое вліяніе, но лучшаго мѣста для установки невозможно найти.

**Высота снѣжнаго покрова** наблюдалась при помощи подвижной рейки, на небольшой площадкѣ около магнитнаго павильона. Знаком  $\boxtimes$  обозначались, согласно правилу, такіе дни, когда снѣгъ оказался не только у рейки, но и въ окрестностяхъ города.

**Продолжительность солнечнаго сіянія** регистрировалась гелиографомъ Величко, установленномъ на площадкѣ башни на высотѣ 18 метровъ надъ поверхностью земли. Показанія гелиографа отсчитывались при обработкѣ до 9 часовъ утра по верхней полоскѣ, отъ 9 часовъ до 3 часовъ по полудни по средней, а съ 3 часовъ до заката по нижней. При отчетахъ принимались во вниманіе всѣ отпечатки, независимо отъ ихъ интенсивности. Печатаются здѣсь отношенія суммы полученныхъ такимъ образомъ величинъ продолжительности солнечнаго сіянія, къ возможной продолжительности, вычисленной астрономически. Эти отношенія меньше дѣйствительныхъ, такъ какъ вслѣдствіе нечувствительности инструмента время дѣйствія солнечныхъ лучей на инструментъ меньше истинной продолжительности солнечнаго сіянія.

Такъ какъ аппаратъ дѣйствуетъ только первый годъ, и притомъ въ теченіе четырехъ мѣсяцевъ: января, февраля, іюня и ноября, не было „ясных“ дней, то матеріалу для опредѣленія величины запаздыванія прибора при восходѣ и заходѣ солнца было недостаточно.

**Наблюденія грозъ** доставлялись въ обсерваторію изъ 62 станцій Балтійскихъ губерній.

## Bemerkungen zum Jahrgange 1901.

**Personal.** Der Laborant am Observatorium cand. C. G. Koch war im Berichtsjahr vom 14. Juni bis zum 29. Juli zur Revision der Regenstationen der Kaiserlichen Livländischen Gemeinnützigen und Oekonomischen Societät abcommandirt und von dann an bis zum 14. August beurlaubt. Im Amte eines ausseretatmässigen Assistenten wurde der Beobachter am Observatorium grad. stud. W. F. Franken bestätigt. Ausserdem betheiligte sich an den Beobachtungen stud. H. G. Koch.

Die Bearbeitung und Vorbereitung des Beobachtungsmaterials zum Druck, sowie die Anfertigung der Monatstabellen für das Physikalische Central-Observatorium wurden in der ersten Hälfte des Jahres von Herrn Koch ausgeführt. Im zweiten Semester ging diese Arbeit an Herrn Francken über, während Herr Koch in der Bibliothek arbeitete und nach den Telegrammen aus dem Physikalischen Central-Observatorium und den hiesigen Beobachtungen Wetterberichte zusammenstellte, die zwei mal täglich zur allgemeinen Kenntnissnahme ausgehängt wurden. Derselbe stellte ferner tägliche Beobachtungen der Declination und Inklination im Magnetischen Pavillon an und bestimmte die Constanten und die Correctur des erdmagnetischen Theodoliten.

Die wissenschaftliche Leitung des Regenstations-Netzes der Kaiserlichen Livländischen Gemeinnützigen und

Oekonomischen Societät lag wie bisher in den Händen des Herrn Prof. Dr. B. I. Sresnewsky; als sein Gehilfe functionirte der Laborant C. Koch. Für das Berichtsjahr wurden wie bisher Monatsberichte sowie ein Jahresbericht publicirt. Ferner wurde eine neue Instruction für die Beobachter ausgearbeitet und versandt und im Laufe der Sommermonate ein grosser Theil der Stationen revidirt. Einen bedeutenden Zuwachs erhielt das Netz durch den Anschluss Kurlands, wo im Berichtsjahr gegen 40 neue Stationen entstanden.

Die **Beobachtungen** erlitten im Berichtsjahr als ersten des achten Lustrums in sofern eine Veränderung, als alle Elemente nur an den drei für Russland gewählten Terminen: 7<sup>h</sup>a, 1<sup>h</sup>p, 9<sup>h</sup>p, abgelesen wurden. Nach wie vor wurden der Niederschlag und das Minimalthermometer um 7<sup>h</sup>a, und 9<sup>h</sup>p beobachtet, das Maximalthermometer um 1<sup>h</sup>p und 9<sup>h</sup>p, die Schneehöhe und Verdunstung um 7<sup>h</sup>a und der Embachstand um 1<sup>h</sup>p.

Der **Luftdruck** wurde 5 Minuten vor den Terminstunden am Heberbarometer Schultze № 2 abgelesen. Die Correction desselben beträgt 0.00 mm und ist im Juni 1892 von Herrn Dubinsky durch Vergleiche mit einem Normalbarometer des Physikalischen Central-Observatoriums bestimmt worden. Im Mai 1902 wurde ein neuer Vergleich angestellt mit Hilfe eines von der hiesigen Realschule angeschafften und vorher am Physikalischen Central-Observatorium geprüften Barometers. Das Mittel aus 10 Vergleichen ergab für unser Barometer eine Correction von — 0.02 mm, was auf die Richtigkeit desselben schliessen lässt. Den Angaben des Thermometers beim Barometer wurde wie bisher die Correction von — 0.4 hinzugefügt, deren Richtigkeit durch eine neue Prüfung im Januar des Berichtsjahres bestätigt wurde. Zur Kontrolle wurde 3 Minuten vor dem Termin den grössten Theil des Jahres über das Barometer Wild-Turretini № 16 abgelesen und zwar vom 1. Januar bis zum 26. Februar und vom 10. April bis zum Schluss des Jahres. In der Zwischenzeit war das Instrument in der Filialstation an der hiesigen Realschule zur Kontrolle des dortigen Barometers. Eine Correction wurde den Angaben des Barometers № 16 nicht hinzugefügt, sondern nur die Differenz zwischen seinen Werthen

und denen des Barometers Schultze berechnet. Diese Differenz beträgt im Mittel 0·21 mm und schwankt zwischen relativ engen Grenzen. Die Mittel der Differenzen Schultze-Turretini sind in Tab. I (pag. 69) angeführt. Der in früheren Jahren constatirte Einfluss der Temperatur und Insolation auf den täglichen und monatlichen Gang der abgelesenen Werthe ist in obiger Zusammenstellung nur undeutlich sichtbar.

Zur kontinuierlichen Registrirung des Luftdruckes diente wie bisher der Aneroid-Barograph Richard № 9939, der die ganze Zeit über befriedigend functionirte. Tab. II (pag. 69) giebt die Monatsmittel der Differenzen Barograph — Barometer Schultze № 2 für die einzelnen Beobachtungstermine. Die Angaben des Barographen nahmen demnach im Laufe des Jahres um 1 mm zu.

Die Aufstellung der Barometer ist wegen der engen Räumlichkeit des Observatoriums leider eine recht ungünstige. Die Instrumente befinden sich an einem nach E gerichteten Fenster eines niedrigen, kleinen heizbaren Zimmers in einer Entfernung von 6 m vom Ofen und  $\frac{1}{2}$  m vom Fenster. Da bei der exponirten Lage des Observatoriums ein stärkeres Heizen unvermeidlich ist, wird namentlich im Winter das Wärmegefälle vom Ofen zum Fenster und von unten nach oben so beträchtlich, dass die einzelnen Theile der Barometer eine verschiedene Temperatur haben. Eine genaue Temperaturcorrection wird dadurch fast unmöglich. Es ist daher im Berichtsjahr von einer stündlichen Bearbeitung der Barographendaten abgesehen und es sind nur die Werthe für die drei Termine publicirt. Dabei ist zu den Barometerangaben zum ersten Mal in diesem Jahrgang die Schwerecorrection im Betrage von 0·9 mm. hinzugefügt.

Nach dem Schluss des Berichtsjahres soll das Barometer № 16 in die für barometrische Messungen sehr geeigneten Räume des Meteorologischen Kabinets übergeführt und dort beobachtet werden. Ebendasselbst ist bereits ein Quecksilber-Barograph Richard № 11558 in Function.

Die **Temperaturbeobachtung** geschah nach dem Assmannschen Aspirationspsychrometer № 139 mit den Thermometern № 677 (trocken) und № 1039 (feucht). Das Instru-

ment musste mehrfach in Folge der Abnutzung des Uhrwerkes in Reparatur gegeben werden, so vom 12—14 Januar und 7 Juni bis 5 September und wurde während dieser Zeit von einem gleichen Apparat № 99 mit den Thermometern № 655 und № 656 ersetzt. Wegen mangelnder electricischer Beleuchtung konnte das Psychrometer nur in den hellen Tagesstunden an der im Jahrgange 1894 beschriebenen Vorrichtung vom Fenster aus abgelesen werden und zwar um 7<sup>h</sup>a vom 5. März bis zum 1. November, um 1<sup>h</sup>p stets und um 9<sup>h</sup>p vom 24. Mai bis zum 28. Juli. Die übrige Zeit hindurch wurde das Psychrometer in der Hütte auf dem Dache abgelesen. Dabei betrug die Höhe des Thermometers über dem Erdboden im ersten Falle 12 m., in der Hütte etwa 9 m. Gegen die verschiedene Aufstellung am — Fenster und in der Hütte — des Psychrometers je nach der Tages- und Jahreszeit lag in sofern kein Bedenken vor, als nach eingehenden Untersuchungen an unserem Observatorium (siehe Jahrgang 1894) für die dunkle Tageszeit gerade an den Terminen 7<sup>h</sup>a und 9<sup>h</sup>p die beiden Fehlerquellen der Hütte: grössere Trägheit und stärkere Wirkung der Strahlung fast vollständig verschwinden.

Da der stündliche Gang der Temperatur durch die bis zum Schluss des vorigen Berichtsjahres durchgeführte Berechnung der stündlichen Temperaturwerthe genügend bestimmt erschien, wurde in vorliegendem Bande die Temperatur nur für die drei Beobachtungstermine publicirt. Zu Untersuchungen speciellerer Natur wurde daher ein grösserer Thermograph angeschafft und schon vor Beginn des Berichtsjahres in Thätigkeit gesetzt. Der neue Thermograph Richard № 26270 war in der Hütte auf dem Dache aufgestellt und functionirte mit Ausnahme der Zeit vom 7.—9. November, wo er durch den alten Thermographen Richard № 10023 ersetzt wurde, das ganze Jahr hindurch. Zwei mal wurde der Apparat im Laufe des Berichtsjahres justirt, und zwar am 29. April, wo sein Nullpunct genau um 15<sup>o</sup> hinunter gerückt wurde, während am 25. November ein Hinaufrücken um ebensoviel Grad stattfand. Die geringe Ausdehnung der Scala, die nur 50<sup>o</sup> umfasst und bis — 15<sup>o</sup> reicht, machte dieses justiren nöthig. Neben

seiner Bourdonschen Röhre war ein unventilirtes Thermometer befestigt, welches zu jedem Termin abgelesen wurde und sowohl mit dem Psychrometer als auch dem Thermographen zu vergleichende Daten geben sollte. In Tab. III (pag. 71) sind die Monatsmittel der Differenzen Thermograph — dem erwähnten Thermometer angeführt, wobei die Angaben des ersteren durch Subtraction von  $15^0$  während der kalten Jahreszeit korrigirt sind, um den Einfluss der erwähnten Justirung aufzuheben. Der Gang der Differenzen zeigt deutlich ein Minimum in der warmen Jahres- und Tageszeit. Um den Einfluss der abnormen Aufstellung der Hütte festzustellen, wurden die Angaben des Thermometers beim Thermographen mit den Daten des Psychrometers zusammengestellt, und zwar gesondert für die Aufstellungen des Psychrometers in der Hütte Tab. IV (pag. 72) und am Fenster Tab. V (pag. 72).

Der Gang der Mittelwerthe in beiden Tabellen zeigt deutlich die Wirkung der Aufstellung auf dem Dache: während durch die Höhe eine so gute Ventilation erreicht wird, dass in der dunklen Tageszeit ventilirtes wie unventilirtes Thermometer fast gleiche Angaben machen, wird die Hütte bei Bestrahlung durch das Dach bedeutend erwärmt. Der ausgeglichene Gang der Temperaturdifferenzen in beiden Tabellen, besonders um 9<sup>h</sup>p. lässt auf die Gleichartigkeit der Angaben des Psychrometers in seinen beiden Aufstellungen schliessen. Der tägliche Gang der Temperatur nach den Angaben des unventilirten Thermometers, also auch des Thermographen wird in der Hütte in Folge der Strahlungseinflüsse selbst im Jahresmittel derart entstellt, dass die Temperatur um die Mittagszeit um  $0^{\circ}44$  zu hoch angegeben wird. Die Extrema der Temperatur nach den ebenfalls unventilirten Extremthermometers dürften eine um mehr als 1 Grad zu grosse Amplitude ergeben.

Als Extremthermometer dienten ein Maximalthermometer von Müller № 4232 und ein unnummerirtes Richtersches Minimalthermometer, die beide in der Hütte aufgestellt waren. Im November des Berichtjahres wurden durch vielfache Vergleiche mit dem Assmann'schen Psychrometer folgende Correctionen gefunden

|  |         |
|--|---------|
| für das Maximalthermometer Müller № 4232 |         |
| bei steigender Temperatur                | —0.002  |
| für das Minimalthermometer Richter       |         |
| bei sinkender Temperatur                 | —0.006. |

Ihrer Geringfügigkeit wegen wurden diese Correctionen nicht angebracht, und unter der Rubrik „Minimum“ wurden die uncorrigirten Angaben des Minimal-Thermometers gedruckt. Diese Werthe weichen natürlich bedeutend von den dem Thermographen entnommenen und noch mehr von den aus den Terminbeobachtungen stammenden Minima ab. Unter der Rubrik „Maximum“ sind nach der Instruction des Physikalischen Central-Observatoriums die den Terminbeobachtungen entnommenen Maxima publicirt. Es könnten jedoch mit grösserer Berechtigung dort die Angaben des Maximum-Thermometers publicirt werden, da sie dem wahren Maximum wohl am nächsten kommen, was durch ihre Uebereinstimmung mit den Thermographendaten bestätigt wird. Es sei daher eine Zusammenstellung derselben in der Tabelle VI (pag. 73) gegeben; die Werthe der dritten und sechsten Columne sind den Aufzeichnungen des Thermographen entnommen. Die Angaben der Extremthermometer stimmen mit denen des Thermographen gut überein, wenn man in Betracht zieht, dass letzteres Instrument in Folge seiner grösseren Trägheit stets etwas geringere absolute Werthe ergeben muss. Die grosse Differenz in den Januar-Minima rührt daher, dass dieselben auf den 1. entfallen und das Minimalthermometer die Temperatur von 9<sup>h</sup>p. des 31. Dec. 1900 wiedergiebt, während beim Thermographen die Temperatur von 12<sup>h</sup>n. genommen ist; der entsprechende Werth für 9<sup>h</sup>p. des 31. wäre — 18.08.

Die **Luftfeuchtigkeit** wurde, bei Temperaturen über Null Grad nach den Angaben des Assmann'schen Psychrometers (nach der Formel von Sprung) berechnet. Die Ablesungen des Haarhygrometers (vom 1 Januar — 1 September № 9 des Physikalischen Central-Observatoriums in St. Petersburg, von dann an bis zum Schluss des Jahres ein gleiches Instrument № 13) dienten zur Bestimmung der Correctionen für letzteres Instrument. Bei Temperaturen unter Null Grad wurde die Feuchtigkeit, wie auch früher, aus den Hygrometerangaben mit Hilfe

der bei Temperaturen über Null Grad gefundenen Correctionen berechnet. Dieselben sind pag. 26 angeführt.

Die Monatsmittel für die relative Feuchtigkeit  $r$  nach der Wehrauchschen Formel  $\frac{\sum a}{\sum s} = r$  berechnet, finden sich in Tab VII (pag. 74).

Eine kontinuierliche Registrirung der Feuchtigkeit lieferte der in der Hütte aufgestellte Hygrograph Richard № 8814, dessen Daten zu speciellen Untersuchungen dienten. Dieselben wurden in derselben Art auf die aus den Psychrometerangaben berechnete Feuchtigkeit reducirt, wie es oben für den Hygrometer beschrieben ist.

Die **Messung des Windes** erfolgte nach dem Anemographen Oettingen-Schultze № 4, dem ein gleicher Apparat № 1 als Ergänzung diente. Die Formeln zur Berechnung der Windgeschwindigkeit in Kilometern pro Stunde waren für

$$\text{№ 4} \quad v = 1.72 + 0.82 n \quad \text{und}$$

$$\text{№ 1} \quad v = 1.00 + 1.67 n.$$

Dieselben sind durch zahlreiche neue Vergleiche im Laufe der letzten Jahre verificirt worden. Es wurde daher, da ein einwurfsfreies Normalinstrument fehlte, im Berichtsjahr von einer neuen Prüfung abgesehen. Die Publication erfolgte unverändert nach dem Muster des vorhergehenden Lustrums.

Gereinigt wurden die Apparate am 2. Juli, wobei aber kein Stillstand eintrat. Am 13. Februar waren Nachts für einige Stunden beide Apparate eingefroren und in der Periode vom 8—15. Februar erschien ihre Bewegung mehrmals durch die ausserordentlich starke Reifbildung ein wenig gehemmt, doch wurde dieses sehr bald bemerkt und beseitigt. Ein Einfrieren eines oder des anderen Apparates erfolgten noch mehrmals, doch ist dadurch kein Verlust in der Registrirung entstanden, da der andere in Thätigkeit blieb.

Die **Verdunstung** wurde mit Hilfe des Evaporometers des Physikalischen Central-Observatoriums № 3 gemessen, das in der Hütte in einer Höhe von 9 m. über dem Erdboden aufgestellt war. Als Uebelstand der Aufstellung muss die Höhe

der Hütte bezeichnet werden, da bei starkem Winde ein wenig Schnee und Regen in die Auffangsschale hineingeweht wird.

Der **Niederschlag** wurde mittelst eines Regenmessers beobachtet, der mit einer Nipher'schen Schutzvorrichtung versehen und in einer Höhe von 12 m. über dem Erdboden aufgestellt war. Eine Beeinflussung des Apparates durch den Wind ist bei seiner Höhe trotz der Schutzvorrichtung nicht ausgeschlossen, doch ist kein geeigneterer Platz zur Aufstellung des Apparates vorhanden.

Die **Schneehöhe** wurde mit einem beweglichen Messtab auf einer kleinen Fläche in der Nähe des Magnetischen Pavillons gemessen. Mit dem Zeichen ☒ wurden der Instruktion gemäss diejenigen Tage bezeichnet, an denen eine Schneedecke nicht nur um den Messtab, sondern auch in der ganzen Umgebung der Stadt bestand.

Die **Sonnenscheindauer** wurde durch einen Heliographen Welitschko registriert, welcher auf der Plattform des Thurmes in einer Höhe von 18 m. über dem Erdboden aufgestellt war. Die Aufzeichnungen desselben wurden bei der Bearbeitung bis 9 Uhr morgens am oberen Streifen abgelesen, von 9 Uhr bis 3 Uhr Nachmittags am mittleren, und von dann an bis Sonnenuntergang am unteren. Dabei wurden alle Aufzeichnungen des Instrumentes in Betracht gezogen, unabhängig davon, wie intensiv sie waren. Publicirt ist in vorliegendem Jahrgang das Verhältniss der so gewonnenen Sonnenscheindauer jedes Tages zu der astronomisch berechneten möglichen. Dieses Verhältniss ist offenbar kleiner als das wahre, da in Folge der Unempfindlichkeit des Instrumentes, die Zeit der Einwirkung der Sonnenscheindauer auf dasselbe kürzer als die Zeit der wahren Sonnenscheindauer ist. Die Grösse der Unempfindlichkeit des Instrumentes liess sich aus Mangel an Beobachtungsmaterial nicht bestimmen, da dasselbe erst ein Jahr functionirt und dabei im Laufe von vier Monaten: Januar, Februar, Juni und November nicht ein einziger „heiterer“ Tag beobachtet wurde.

**Gewitterbeobachtungen** wurden an 62 Stationen in den Baltischen Provinzen angestellt und ans Observatorium eingesandt.
