

Table 1. Estimated main effects (mean and 95% CI) in male subjects and estimated main and interaction effects (mean and 95% CI) in female subjects of the ECPBHS sample in anthropometric measurements and biochemical measures from 15 to 25 years of age between *TFAP2B* intron 2 VNTR genotype according to the linear mixed effects regression model.

Characteristics ⁵	MALES ¹			FEMALES ²		
	Coefficient ³	95% CI	p value	Coefficient ⁴	95% CI	p value
Body weight (kg)						
4/4 genotype	-1.350	-5.113; 2.414	0.482	2.761	-2.991; 8.512	0.347
4/5 genotype	-1.984	-3.949; -0.018	0.048	4.209	0.882; 7.537	0.013
4/4 genotype × time				-0.170	-0.481; 0.141	0.285
4/5 genotype × time				-0.249	-0.432; -0.066	0.008
BMI (kg/m²)						
4/4 genotype	-0.528	-1.540; 0.485	0.307	1.011	-0.941; 2.963	0.310

¹ Models did not include time × *TFAP2B* intron 2 VNTR interaction

² Models included time × *TFAP2B* intron 2 VNTR interaction

³ Coefficient can be interpreted as the mean difference in anthropometrical measurements and biomarkers between *TFAP2B* intron 2 VNTR 4/4 and 5/5 genotype or between 4/5 and 5/5 genotype at each timepoint.

⁴ Difference in the rate of change in anthropometrical measurements and biomarkers between *TFAP2B* intron 2 VNTR 4/4 and 5/5 genotype or between 4/5 and 5/5 genotype can be calculated as the sum of main effect coefficient and time × interaction coefficient at given timepoint.

⁵ Means and 95% confidence intervals are graphed in Figures 1–3 for a clear visualization.
