Märkusi 1934. aasta kohta.

Õhurõhumist loeti Müller'i baromeetrilt N 560, mis asus merepinnalt 80.81 m kõrgusel. Interpoleerimiseks kasutati Richard'i barograafi N 11558 andmeid.

Õhutemperatuuri mõõdeti observatooriumi aias Assmann'i aspiratsioonpsühromeetriga 2 m kõrgusel maapinnalt (68 m merepinnalt). Maksimum- ja miinimumtermomeetrid ning termograaf asusid seejuures inglisonnis samal kõrgusel maapinnalt.

Absoluutset ja relatiivset niiskust määrati sulailmade puhul Assmann'i psühromeetri andmeil. Külma puhul määrati relatiivset niiskust juushügromeetri abil, ning selle põhjal absoluutset. Hügrograafid, mille üleskirjutisi kasustati relatiivse niiskuse väärtuste interpoleerimisel, asusid aias inglisonnis.

Tuulevaatlusi toimetati Kusnetsov-Masing'i ning Oettingen-Schultze' süsteemi anemograafide abil, mis asusid observatooriumi vaatlustornis 29 m kõrgusel maapinnalt (96 m merepinnalt).

Sademete mõõtmiseks tarvitati venesüsteemilist sademetemõõtjat ning Hellmann'i iseregistreerijat. Mõlemad asusid observatooriumi aias.

Auramist mõõdeti Wild'i evaporomeetriga, mis asus aias inglisonnis.

Lumikatte paksust mõõdeti aias asuva mõõdupuuga. Sealsamas mõõdeti ka lume tihedust, kusjuures trükitud andmed väljendavad keskmist lumetihedust kogu lumekihis, s. o. maapinnalt kuni lumekihi pealispinnani.

Emajõe veepinna kõrgust loeti mõõdupuult, mille nullpunkt asus 29.51 m kõrgusel merepinnalt.

Emajõe veetemperatuuri ja jääpaksust mõõdeti Tartu linna ujulas.

Päikesepaistet registreeris Velitško heliograaf, mis asus observatooriumi vaatlustorni platvormil. Päikese kiiritamise intensiivsuse mõõtmisi toimetati observatooriumi maja IV korral asuva lõunapoolse toa aknal 15 m kõrgusel maapinnalt, milleks kasustati Ångström'i pürheliomeetrit N 197.

Maapinnatemperatuuri mõõdeti vaatlusaias tabelites nimetatud sügavustel.

Rahvusvaheliselt kindlaksmääratud päevadel korraldati kõrgemate õhukihtide vaatlusi pilootpallide ja Bosch'i süsteemi N 2564

meteorograafi abil; viimane kinnitati kõrglendude ajaks lennuki tiibade vahele.

Observatooriumi kaastööliste isiklikku koosseisu 1934. aastal kuulusid järgmised isikud: inspektor — A. Kärsna; teaduslik ametnik — H. Liidemaa; vanem assistent — E. Maanvere; abiassistendid — P. Kaur (kuni 31. VI) ja K. Sule (alates 1. VII); sünoptikud — A. Nurklik ja A. Ohu; vaatlejad — J. Kukk ja J. Limberg; kantseleiametnikud — T. Raielo ja H. Lokko.

Käesolevas aastaraamatus avaldatud vaatlusandmed on kontrollitud H. Liidemaa ja allakirjutanu poolt.

K. Kirde

Meteoroloogia Observatooriumi juhataja.

Notes for the Year 1934.

Atmospheric pressure was registered by means of a barometer of the Müller type N 560 placed 80,81 m above sea-level. The recording barograph of the Richard type was used for interpolation. The air temperature was obtained by means of an Assmann psychrometer placed in the garden of the Observatory at a height of 2 m above the ground (68 m above sea-level). The maximum and minimum thermometers and the self-recording thermograph were placed at the same height and sheltered by a screen.

The absolute and relative humidity was obtained by means of the Assmann psychrometer on days when the temperature was above the zero of the centigrade scale. On cold-weather days the relative humidity was determined from the Hair-Hygrometer, and hence the absolute humidity was deduced. The self-recording hygrograph for the interpolation was sheltered by a screen and placed in the garden.

The wind was registered by means of self-recording anemographs of the Kusnetzov-Masing and Oettingen-Schultze types placed on the roofplatform at a height of 29 m (96 m above sea-level).

Precipitation was measured by means of a rain-gauge of the Russian type and of a Hellmann self-recording apparatus, both placed in the garden of the observatory at a height of 2 m.

The evaporation was registered by means of a Wild Evaporimeter sheltered by a screen.

The depth of the snow was measured with a measuring-pole in the garden, where the density of snow was also determined. The data given in the table express the density of the whole snow-layer. The water-level in the river "Emajõgi" was determined by means of a measuring-pole, whose zero point was 29,51 m above sea-level.

The duration of sunshine was registered by means of a Welitshko Heliograph, placed on a platform above the roof of the observatory.

The intensity of solar-radiation was measured with an Ångstrom's Pyrheliometer No 197 through an open window at a height of 15 m above the ground.

The temperature of the ground was measured in the garden of the Observatory at the depths given in the table.

On international days the observations of the atmosphere were made by means of pilot-ballons and of the Bosh meteorograph fixed to an aeroplane.

The staff of the Observatory consisted of the following officials: inspector — A. Kärsna; scientific collaborator — H. Liidemaa; chief-assistent — E. Maanvere; subassistent — P. Kaur (till 31. VI) and K. Sule (from 1. VII); forcasters — A. Nurklik and A. Ohu; observators — J. Kukk and J. Limberg; clerks — T. Raielo and H. Lokko.

The observations were controlled by H. Liidemaa and the undersigned.

K. Kirde

Director of the Meteorological Observatory.

Märkusi II-järgu jaamade kohta 1934. a.

Kõigis II-järgu meteoroloogiajaamades toimetati vaatlusi samatüübiliste vaatlusinstrumentidega ühise kava järele nagu eelmistel aastatel.

Vaatluste tähtaegadel mõõdeti õhurõhumist kaussbaromeetritega kuna õhurõhumise käiku registreerisid barograafid. Psühromeetrid, äärmustermomeetrid, juushügromeetrid ja termograafid asetsesid inglisonnides. Tuule suuna ja kiiruse mõõtmiseks tarvitati Wild'i süsteemi tuulelippe. Sademeid mõõdeti sademetemõõtjatega, püüdepinnaga 500 sm^2, mis varustatud tuulekaitsjatega. Pääle ülalmainitud instrumentide olid jaamades päikesepaiste isemärkijatena tarvitusel Weličko süsteemi heliograafid.

Kõigis jaamades toimetati vaatlusi keskmise kohaliku aja järele kell 7, 13 ja 21. Sademete hulk iga päeva kohta on antud millimeetrites hommiku kella 7-st järgneva päeva kella 7-ni.

Avaldatud vaatlusandmeis on arvestatud vastavaid instrumentaalõiendusi ning õhurõhumise andmeis veel temperatuuri- ja raskustungiõiendusi.

Vaatlusandmed on avaldatud 25 jaamast, mille konstantarvud on tabelis lk. 94.

Käesolevas aastaraamatus esinevad esmakordselt Toolse (algas tegevust 1933. a. lõpul) meteoroloogiajaama andmed.

Vaatlusandmete läbitöötamist toimetasid Observatooriumi ametnikud T. Raielo ja H. Lokko. Jaamade revideerimist koha peal, vaatlusriistade võrdlemist ja vaatlusandmete kontrollimist teostasid Observatooriumi inspektor A. Kärsna ja allakirjutanu.

Dr. K. Kirde.
Met. Observatooriumi juhataja.

Notes to the Stations of Second Order.

At all the meteorological stations of second order the observations were made with the same instruments and according to the same instructions as in the previous year.

The pressure was taken with the mercury barometers, whereas the variations of pressure were recorded by means of barographs.

The hygrometers, extreme thermometers, and thermographs were placed in psycrometric screens. For the recording of wind directions and velocity the wind-vanes of Wild were used. The precipitations were measured by rain-gauges of 500 cm^2 receiving surface at a height of 2 m protected by Nipher type shields of funnel shape. Except the above mentioned instruments the stations were provided with Welitchko sunshine recorders.

At all the stations the observations were made at 7^h, 13^h and 21^h mean local time. The daily amount of precipitations from 7^h till 7^h of the next day is given in mm.

The instrumental correction has been taken into consideration in all the observations; for those of pressure — also the corrections of temperature and gravity.

This book contains the observations of 25 stations.

The observations of Toolse, which station began its work 1933, are included into this volume for the first time.

The data have been worked out by the employees T. Raielo and H. Lokko. The revision of the stations as well as the control of the observations was done by Inspector A. Kärsna and the undersigned.

Dr. K. Kirde.

Märkusi sademete-, äikese- ja lumevaatluste kohta.

Sademete-, äikese- ja lumevaatlusi toimetati pääle II-järgu jaamade veel alamajärgulistes ilmajaamades ja vaatluskohtades, kokku 171 kohas. Pääle selle märgiti mõnes vaatluskohas veel sisevete kinnikülmumist ja lahtiminekut.

1934. a. töötas Eestis 117 sademetejaama. Nende vaatlusandmed on avaldatud käesolevas aastaraamatus koos 25 II-järgu meteoroloogiajaama andmetega. Sademete hulka mõõdeti igapäev kella 8 ajal tuulekaitsjatega varustatud sademetemõõtjatega, mille püüdepind on 500 sm^2. Kõik sademetemõõtjad asetsesid 2 meetri kõrgusel maapinnalt. Tabelites esinevad sademete kuu- ja aastasummad, kõige suurem ööpäevane hulk ja päevade arv sademetega. Lumepäevadeks on arvatud need päevad, mil on sadanud lund ning sademete koguhulk hommiku kella 8-st järgmise päeva kella 8-ni oli vähemalt 0,1 mm.

Äikese- ja rahevaatlusi toimetati 152 vaatluskohas. Tabelites on antud kõue ja rahesaju algus ning kõue- ja rahepäevade arv. Märk ⊏ tähendab lähedat kõuet, ⊤ — kauget kõuet ja ◁ — pälku. Äikese- või rahekahjude korral on vaatlusandmed trükitud rasvaselt. Tabelites leiduv punkt (.) tähendab, et vaatlusi ei ole toimetatud või nad on avaldamiseks puudulikud, kriips (—) aga, et vastavat nähtust ei ole olnud.

1934./35. a. talvel toimetati lumevaatlusi 136 vaatluskohas. Lumekõrgust mõõdeti nagu eelmistelgi talvedel kell 8 hommikul. Vaatlustel tarvitati sentimeeterjaotustega mõõdupuud, mis asetatud tuule eest kaitstud tasasele kohale. Tabelites on antud dekaadide (10 päeva) keskmine lumekõrgus sentimeetrites. Null (0) tähendab, et dekaadi keskmine lumekõrgus oli alla 0,5 sm, kriips (—), et dekaadi kestel pole lumikatet olnud, punkt (.), et vaatlusi pole toimetatud.

Sademete-, äikese-, rahe- ja lumevaatluste jaoks on antud ühine vaatluskohtade nimestik tähestikulises järjestuses. Samuti on kõigis tabelites vaatluskohad järjestatud tähestiku järele.

Sisevete kinnikülmumise ja lahtimineku ajad leiduvad tabelis lk. 152. Kinnikülmumise ajaks loeti päev, mil vaadeldav veeala kattus kuitahes õhukese jääkorraga või, mil liikuv jää jäi seisma ning külmus kokku. Vete lahtimineku ajaks loeti päev, mil jääkate katkes või hakkas liikuma.

Lumi- ja jääkatte kestus on antud nende päevade kohta, mil lumi- või jääkate oli tõeliselt olemas. Kui sulade ilmade tõttu see vahepeal puudus ja hiljem uuesti ilmus, siis on kestus antud mitme arvuga, mis omavahel ühendatud pluss (+) märgiga.

Vaatlusjaamade ülesleidmise hõlbustamiseks on aastaraamatu lõppu paigutatud kaart „Eesti meteoroloogiajaamad".

Vaatlusandmeid töötasid ümber observatooriumi ametnikud T. Raielo ja H. Lokko, kuna andmete kontrolli teostasid observatooriumi inspektor A. Kärsna ja allakirjutanu.

K. Kirde.
Met. Observatooriumi juhataja.

Notes on Precipitations, Thunderstorms, and Height of Snow Layer.

The observations of precipitations, thunderstorms, and height of snow layer were made at 171 observation points, comprising stations of 2nd order and other special observation points. The freezing and the opening of the inland waters were also observed at some of these stations.

Precipitations were observed at 117 stations in 1934; besides these, the observations of 25 stations of 2nd order have also been included in this year-book. The precipitations were measured every morning at 8 o'clock by means of a rain-gauge of 500 cm^2 receiving surface protected by funnel-shaped Nipher type shields.

All the rain-gauges were placed at a height of 2 m above the ground. The tables contain the monthly and yearly amounts of precipitations in mm, the maximal daily amounts, and the number of days on which rain fell.

Days with snow-fall on which the daily amount of precipitations from 8 till 8 o'clock was at least 0.1 mm are reckoned as days with snow-fall.

The observations of thunderstorms and hail-fall were made at 152 observation points. The tables show the beginning of thunderstorms and of hail-fall and the number of days on which they were observed. The sign ⊓ denotes a thunderstorm in the neighbourhood, ⊤ — thunder, and ↯ — heat-lightning. Cases of damage produced by lightning or hail, are printed fat. A dot (.) denotes either that the observation was not made or that it was unreliable, a dash (—) — an absence of the corresponding phenomenon.

The height of snow layer was measured at 136 observation points. The observations were made at eight o'clock wery morning

by means of a pole divided into cm in a level place protected from the wind. The tables contain the average height of snow layer for each decade; (0) denotes, that the average height of snow layer was less than 0.5 cm, a dash (—) — an absence of snow layer during the decade, and a dot (.) — an absence of observation. In all the tables the stations are ordered alphabetically.

The freezing and opening of the inland waters are given on page 152. A day when the observed water surface was covered with ice, be it ever so thin, or when the floating ice began to solidify, is considered as the beginning of solid ice-cover. The day on which the ice cover began to move or some openings were formed in it, is considered as a day on which the opening of the water began.

If the snow layer or the ice cover was intermitted by thawing weather, the durations of separate periods are expressed by corresponding figures joined by the sign of +.

In order to present a better survey a map with all the observation points is given at the end.

K. Kirde.

Director of the Meteorological Observatory.
